

EPINOR Summer School light in Trondheim

Our local summer school in Trondheim was a great success with 18 participants. The main topic was how to control confounding effects by study design and statistical analyses. Local professors from NTNU did a great job in communicating important epidemiological research questions. Lars Johan Vatten initiated the course with a lecture about “the job is not done until the paper work is done”. Johan Håkon Bjørngaard and Tom Ivar Lund Nilsen continued then with confounding and effect modification. The course included both lectures and computer exercises with the use of real datasets.

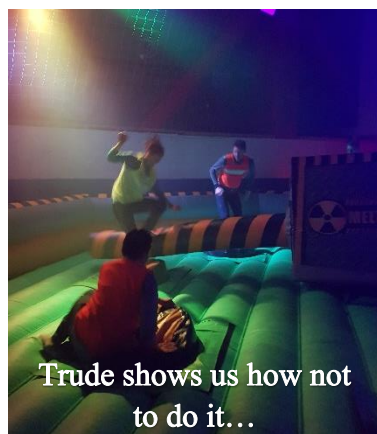

Serious phd-candidates

Happy phd-candidates

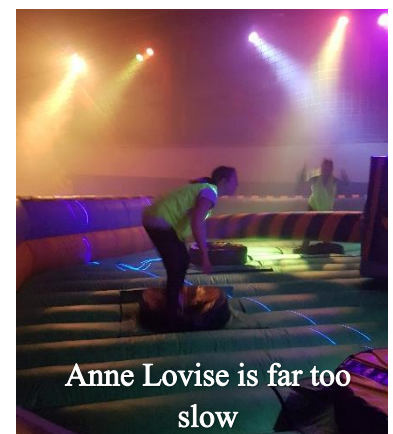

After the computer exercises on day one, a mini bus transported us to a secret location where we split us into two teams (girls against the boys) and competed in Wipeout, Blacklight Dodgeball and Lazer Tag. The boys won the prestigious battle. This part became a bit rough though, because some of the participants experienced several pulled muscles and muscle soreness. Anyway, this was quickly forgotten when we consumed delicious burgers and ‘soft drinks’ afterwards. All the candidates agreed: “We can hardly wait for the summer school next year!”

Trude shows us how not to do it...

Lars is the last man standing

Anne Lovise is far too slow
